## BRIEF DESCRIPTION OF THE RESEARCH ACTIVITIES

Luca's research is focused on the synthesis, spectroscopic and structural characterizations of molecular systems, and the study of their reactivity and magnetic, optical and biological properties upon modulation of their electronic features.

**Keywords:** nonlinear optics (NLO), magnetic properties, spin crossover (SCO), single-molecule magnets (SMMs), structure-property correlation, chemometrics, transition metals, lanthanides, Schiff bases, ligand functionalization, polynuclear complexes, metal-organic frameworks (MOFs), coordination polymers (CPs), curcumin, radio-drugs, cytotoxicity, cerium, bioglasses, composite materials, epoxy resins, polyurethanes, didactics.

- Copper(II) complexes with NNO tridentate Schiff base ligands: synthetic strategies from mono to oligonuclear derivatives through metal template effect; structural characterisation with single crystal X-ray diffraction; study of the magnetic communication between the metal centres through the bridging ligands and modulation of their features by the effect of peripheral substituents; insertion of chiral centres along with the ligand organic skeleton for chiral induction in trinuclear propeller-like complexes; studies of their biological behaviour as potential anticancer agents.
- Cobalt(II) compounds with tridentate nitrogen-rich donor ligands: modelling through chemometrics tools, synthesis of new ligands and crystallization of the corresponding cobalt(II) complexes; structural characterisation with single crystal X-ray diffraction; study of the magnetic properties for SMM behaviour: modulation of the slow relaxation of the magnetization through external stimuli like pressure, or by efficient coupling with redox- or photo-active molecules; supramolecular organization into MOFs and CPs.
- Iron(II) compounds with tridentate nitrogen-rich donor ligands: synthesis of new ligands and crystallization of the corresponding iron(II) complexes; structural characterisation with single crystal X-ray diffraction; study of the magnetic properties for SCO behaviour: modulation of the thermodynamically-stable ground spin state through ligand functionalization; photo-induced and under-pressure magnetic studies for metastable spin state trapping.
- Oligonuclear copper, cobalt, iron and manganese compounds with tetra- and penta-dentate salen-type Schiff base ligands: synthesis of ligands and metal complexes with also mixed oxidation states; structural characterisation with single crystal X-ray diffraction; characterization of the anomalous coordination environments; study of the magnetic communication between the metal ions through the bridging ligands and stabilization of ground spin states  $S \neq 0$ ; study of the catalytic activity in different coupling reactions.

- Structural and magnetic characterizations of oligonuclear SMMs and their functionalization for anchoring on surfaces; study of structural modifications of known SMMs in order to enhance their evaporability (e.g. use of fluorinated ligands) and magnetic anisotropy (i.e. through the insertion of rare earth ions).
- Transition metal complexes with tetradentate Schiff base ligands and macrocycles possessing a permanent dipole moments for application in NLO: metal-assisted template synthesis (Cu, Ni, Zn and other metals) for unsymmetrically-substituted Schiff base assembly; experimental measurements of first-order hyperpolarizability  $\beta$  with Electric Field Induced Second Harmonic generation (EFISH), Hyper-Rayleigh Scattering (HRS) and solvatochromic techniques; use of theoretical calculations (optimised geometries, dipole moments  $\mu_g$ ,  $\beta$  values, etc.) in understanding structure-property relationship.
- Extended delocalised chain dipolar organometallic compounds for second- and third-order NLO: use of palladium-catalysed Sonogashira coupling reactions to obtain long arylene-ethylene conjugated chains and coupling with electron-rich ruthenium(II) centres (e.g. *cis*-[RuCl<sub>2</sub>(dppe)<sub>2</sub>]); photo-, redox- and proton-modulation of the NLO response.
- Synthesis, reactivity, structural and spectroscopic (NMR) studies of square planar platinum(II) coordination compounds with neutral phosphorous ligands (e.g. PPh<sub>3</sub>, POR<sub>3</sub>); experimental and theoretical quantification of the *cis* and *trans* influences in *cis/trans*-[PtXY(PPh<sub>3</sub>)<sub>2</sub>] and *cis*-[PtXL(PPh<sub>3</sub>)<sub>2</sub>]<sup>+</sup> derivatives (X, Y = anionic ligands, e.g. NO<sub>3</sub><sup>-</sup>, AcO<sup>-</sup>, L = neutral ligand, e.g. PPh<sub>3</sub>, pyridine, NH<sub>3</sub>).
- Synthesis of new radio-drugs specifically designed for the early diagnosis of the Alzheimer disease, obtained from the combination of a bifunctional chelating agent, which shown affinity for amyloid fibrils/aggregates, with a positron radio-metal emitter (<sup>68</sup>Ga) to be employed in the Positron Emitting Tomography (PET). The molecular structure targeting the amyloid aggregates is curcumin, polyphenol extracted from Curcuma Longa L., and its synthetic derivatives variably functionalised with the aim of linking the chelating fragment, represented by macrocycles employed in radio-medicine.
- Composites based on inorganic (such as silicon carbide as abrasive) and organic (epoxy resins and polyurethanes, etc.) materials for glass and stone processing and enhancement of their technological performances.
- The fundamental chemical concepts and their perception in the educational field and in teaching in schools of all levels, creation of *ad hoc* questionnaires for students and evaluation of the answers in search of misconceptions rooted in the education of children and study of strategies to improve teaching.

The different research activities take advantage of the intensive collaboration with several National and International researchers and professors all around the World.
