BRIEF DESCRIPTION OF THE RESEARCH ACTIVITY

- His main research interests are related to the petrogenetic processes at the crust-mantle transition. Within this line of research, he studied: a) Sections of old deep and intermediate crust (Ivrea-Verbano Zone); b) Continental anorogenic magmatism (Southern America Cratons); c) Continental lithospheric mantle (Ivrea Mantle bodies and South American mantle xenoliths). Currently he is working on: i) fluid and melt percolation processes through mantle peridotite matrix; ii) the role of mantle heterogeneity in subcontinental peridotite massifs and the genesis of basic magma; iii) mass transfer process of fluids in hydrated and carbonated mantle rocks from suprasubductive settings; iv) growth mechanism of mafic-ultramafic layered complexes; v) studies of mafic dike swarms as key markers of their mantle source, the petrogenetic evolution and the geodynamic environment in order to constrain the paleogeographic reconstruction.
- Main Expertises: Analytical chemistry on whole rock and mineral samples through X-Ray fluorescence spectrometry (XRF), Atomic Absorption Spectrometry (AAS), Scanning Electron Microscopy (SEM), Electron Probe Micro Analyses (EMPA). Isotopic systems of expertise: $^{87}\text{Sr}/^{86}\text{Sr}$, $^{143}\text{Nd}/^{144}\text{Nd}$, $^{206}\text{Pb}/^{204}\text{Pb}$, $^{207}\text{Pb}/^{204}\text{Pb}$, $^{208}\text{Pb}/^{204}\text{Pb}$.
